

# Quickmill's Header Pipe Processing System

At Quickmill we continue to work with our Heat Transfer customers to develop more efficient ways of processing their parts including header pipes. Quickmill's Eliminator Gantry machines have proven ideal for this application with their large bridge gaps, flexible table sizes, and a powerful CNC system.

Quickmill has developed a Turnkey hydraulic clamp and CNC Rotating System allowing customers to process pipes from 100mm up to 610mm in diameter and larger on one machine. The gear driven roller supports, hydraulically operated clamping system, and rotator allow for easy adjustment of a wide range of pipe sizes with a push of a button.

With our optional Right Angle Head you can mill the pipe ends to length with a weld prep to finish the pipe in one setup.

As an added bonus, we have designed the system to be removable, allowing greater flexibility. With the pipe processing system removed you have the flexibility to machine Tube Sheets, Condensers, or any other product you wish to process on the versatile Quickmill Eliminator Gantry Machines.
